Standard Management Practices for University of Minnesota Grass Seed Production Research Plots

General management regime of research plots in Northern Minnesota:

Spring seeded ryegrass with wheat-BMP(best management practice)

Ryegrass seeded at 5#/acre with spring wheat

Sterling Blue(dicamba)+ 2,4-D amine 4 (0.75 + 0.75 pint) applied in late September

Fertilize 30-50-50 after small grain harvest

Spike tooth harrow after fall fertilizer application to spread straw

Fertilize 110-0-20s(15#ESN) applied early May, 300 - 600 GDD

Sterling Blue+ 2,4-D amine 4 (0.75+0.75 pint) applied late May, 700 - 900 GDD

Tacoma or Assure II (8-10 oz) applied early June, 800 - 1,000 GDD

Apogee (6-8 oz) applied early heading, 1,100 - 1,300 GDD

Priaxor 6oz.or Quilt Xcel 12oz. applied full heading, 1,700 - 1,900 GDD or as needed

Fall seeded ryegrass in wheat stubble

Pre-harvest glyphosate application to wheat , or

glyphosate applied to wheat stubble prior to seeding ryegrass, if needed.

Drill ryegrass at 6#/acre after wheat harvest into existing stubble

Fertilize 30-50-50 at planting

If planting into summer fallow, apply 11-50-50.

Intermediate Wheatgrass/Kernza

Establishment=Seed at 10#/acre in late August in 6"-8" rows.

120-40-40-10s applied in late October.

.75pt. 2,4-D a + .75pt. Sterling Blue late September or May as needed.

Field burn in early September after harvest.

Kentucky bluegrass

Establishment=Seed at 4#/acre in late August to early September.

120-40-40-10s applied in late September.

.75pt. 2,4-D a + .75pt. Sterling Blue late September.

Field burn in August.

General seed harvest procedure for small research plot

Note: Years sited on the summary tables are generally the year the trial was planted or initiated.

Measured areas are hand cut and bagged for each individual plot.

These samples are then brought to the U of M St.Paul campus

where they are dried, threshed, cleaned and weighed.

Seed yields, quality and other data are statistically analyzed and results summarized.

On-farm small plot research trials

General crop management is done by the grower/cooperator.

Application of treatment variables, agronomic notes and harvest performed by U of Mn personnel.

Effort is made to remove research samples prior to grower harvest.

Cooperators are asked to avoid management applications of treatments involved in the study to the research plot area.

On-farm large plot trial research protocol

These experiments are conducted in fields with growers implementing all of the general field management.

Treatment variables are field scale and are applied either by the grower or University personnel.

University agronomists and grower cooperators work together to insure treatment variables are properly applied.

Plant samples, crop development observations and other applicable notes

are recorded as needed throughout the growing season usually by University personnel.

At harvest, University agronomists will assist the growers in collecting quality samples and recording harvest data.

Experimental design usually consists of 2 or 3 treatment variables and 3 replicates/treatment.

2023 Research Locations

MagPlots=University of Minnesota-Magnusson Research Farm 2 miles north and 4.5 miles west of Roseau,Mn

Northern Resources=West Plant-Roseau

MagFarms=Magnusson Farms- NW of Roseau

Casey Pearson=NW of Roseau

Rice Farms= NW of Roseau

Estling Farm=North of Roosevelt

Stanley Farms=Grygla area

Total	59	51	53	21	56	103	93	436

The seven armyworm moth trapping locations in 2023:

Location 1: Dieter Township, Section 3, NW quarter. Trap placed in the middle of a perennial ryegrass field.

Location 2: Jadis Township, Section 7, SW quarter. Trap placed in the middle of a perennial ryegrass field.

Location 3: Jadis Township, Section 5, SW quarter. Trap placed in the border of a perennial ryegrass field.

Location 4: Stafford Township, Section 3, NW quarter. Trap placed in the middle of a perennial ryegrass field.

Location 5: Malung Township, Section 18, SW quarter. Trap placed on field border of two perennial ryegrass fields.

Location 6: Laona Township, Section 4, SE quarter. Trap placed field border of two perennial ryegrass seed field.

Location 7: Chilgren Township, Section 30, SW quarter. Trap placed on the border of two perennial ryegrass fields.

In 2023, this armyworm moth trapping project documented five flights with moth captures that averaged over 3 moths/night.

The calendar dates and the number of moths collected were:

- May 19-23 = 43
- May 31-June2 = 40
- June 4-5 = 195
- June13-19 = 101
- June 25-29 = 57

Summary

Over a two-year period, this armyworm moth trapping project documented that the Scentry pheromone trap was effective in trapping armyworm moths.

This moth trapping project documented four major flights in 2022 and five flights in 2023.

Low-level jet stream maps produced by the University Center for Atmospheric Research (UCAR), can be used to document low-level jet stream events in the perennial ryegrass growing regions of northern MN.

Localized thunderstorms and rain events seem to be important

in the deposition of armyworm moths into the perennial ryegrass growing region of northern MN.

The next step in this project will be to build information learned from this armyworm moth trapping project and try and determine a correlation between the number of trapped moths and number of armyworm larvae in ryegrass fields.
