

# **PROGRESS REPORT ON GRASS SEED PRODUCTION RESEARCH**

prepared by

N. Ehlke, D. Vellekson, and D.Grafstrom

Department of Agronomy and Plant Genetics

University of Minnesota

St. Paul, Minnesota 55108

## **Grass-Legume Seed Institute Presentation**

**Roseau, MN - February 15, 2017**

This summary and previous annual research summaries are on the Web at:

[http://www.mnturfseed.org/html/progress\\_reports.html](http://www.mnturfseed.org/html/progress_reports.html)

Table 1. Precipitation Data 1967-2016.

### **Variety Performance Trials:**

Table 2. Perennial Ryegrass Seeded in 2015.

Table 3. Perennial Ryegrass Winter Hardiness Trials seeded 2015.

### **Perennial Ryegrass Management Trials:**

Table 4. On Farm Added Liquid Nitrogen- Magnusson Farm.

Table 5. Liquid Nitrogen Added-MagPlots.

Table 6. Fertility Trial and Yearly Yield Summaries-MagPlots.

Table 7. Dry Phosphorous Application Rate and Timing-MagPlots.

Table 8. Liquid Phosphorous Applications-MagPlots.

Table 9. Late Application Wild Oat/Grass Herbicide Control-Rice and MagPlots.

Table 10. Resistant Wild Oat Control-Dahlgren Farm.

Table 11. Volunteer Wheat Suppression in Fall Seeded Ryegrass-Brateng Farm.

Table 12. Fungicide Applications to Ryegrass-Pieper and Rice Farms.

Table 13. Ryegrass Planting Options Comparison-MagPlots.

Table 14. Residue Management of Fall Planted Ryegrass-MagPlots.

Table 15. Summary of Second Year Seed Production Trials-Brateng and Rice Farms.

### **Other Trials:**

Table 16. Herbicide Applications to Hard Fescue-MagPlots.

Table 17. Growth Regulator Applied to Spring Wheat -MagPlots.

Table 18. Dual Purpose Cover Crops-MagPlots.

Table 19. Intermediate Wheatgrass-MagPlots and Estling Farm.

## **Standard Management Practices for University of Minnesota Perennial Ryegrass Seed Production Research Plots**

***General management regime of perennial ryegrass plots on the Magnusson Research Farm:***

### **Spring seeded ryegrass with wheat**

Ryegrass seeded at 5#/acre with spring wheat  
Banvel+ 2,4-D amine (0.75 + 0.75 pint) applied in mid-September  
Fertilize 30-30-30 mid-September after small grain harvest  
Spike tooth harrow after fall fertilizer application to spread straw  
Fertilize 100-0-0 applied early to mid-May, 300 - 600 GDD  
Banvel+ 2,4-D amine (0.75+0.75 pint) applied late May, 700 - 900 GDD  
Tecoma or Assure (8-10 oz) applied early June, 800 - 1,000 GDD  
Apogee (6-8 oz) applied early heading, 1,100 - 1,300 GDD  
Quilt Excel (10 oz) applied full heading, 1,700 - 1,900 GDD

### **Fall seeded ryegrass in wheat stubble**

Ryegrass seeded at 5-6#/acre after wheat harvest into existing stubble  
Pre-harvest glyphosate application to wheat , or  
glyphosate applied to wheat stubble prior to seeding ryegrass.  
No broadleaf application in fall but other management for fall seeded ryegrass the same as spring seeded.

### **General ryegrass seed harvest procedure for small research plot**

Measured areas are hand cut and bagged for each individual plot.  
These samples are then brought to the U of M St.Paul campus  
where they are dried, threshed, cleaned and weighed.  
Seed yields and other data are statistically analyzed and results summarized.

### **On-farm small plot research trials**

All crop planting and general management are done by the grower/cooperator.  
Application of treatment variables, agronomic notes and harvest by University of Minnesota personnel.  
Cooperators will avoid applications of treatments involved in the study to the research plot area.

### **On-farm large plot trial research protocol**

These experiments are conducted in fields with growers implementing all of the general field management.  
Treatment variables may be applied either by the grower or University personnel.  
University agronomists and grower cooperators work together to insure treatment variables are properly applied.  
Plant samples, crop development observations and other applicable notes  
are recorded as needed throughout the growing season usually by University personnel.  
At harvest, University or local agronomists will assist the growers in collecting quality samples and recording data.  
Experimental design usually consists of 2 or 3 treatment variables and 3 replicates/treatment.

Table 1.

**Monthly and Year End Precipitation Totals\***

Roseau,Mn 1967-2016.

Main effect means for late season traits: seed yield, harvest index (HI), lodging and plant height (PH). Trial years were separated when there was an interaction with treatment. There were no significant effects of plant growth regulator in the ANOVA, therefore it was excluded from means separation.

Treatment	Seed Yield			HI			Lodging			PH

			2013-14	2014-15	2015-16
Bale and mow	Cut short and remove straw	NA	8/20/13	8/27/14	8/27/15
Field burn	Paraquat (gramoxone)	1.5 Pt.	8/20/13	8/27/14	8/27/15
	Physical burn	NA	8/29/13	9/7/14	9/18/15

In summary, economically viable second year perennial ryegrass seed production is possible in northern Minnesota using current winter hardy commercial varieties, proven agronomics, and appropriate residue management. In this study, environmental conditions varied greatly across years and a wide range of common soil types were trialed. Over the three trial years extreme minimum soil temperatures ranged from above average to the coldest observed in ten years. Future research should focus on testing fall fertilizer and pre-emergent herbicide application rates and timing to increase yield and maintain seed purity over time.
